Janusz Wielki: E-space development and its consequences in the context of the non-marketing-mix related elements of the marketing activities of organizations	111
Radosław Wójtowicz: The profile of free teamwork software	120

Preface

We are presenting to our valued readers the sixth volume in the series of monographs entitled “Advanced Information Technologies for Management”. The series was initiated in 2001 and a new volume is produced each year. The purpose of this initiative has been the successive publication of research results in the area of business information systems. In order for such systems to effectively support long-term management processes, they must relate to current models of conducting business initiatives and their development directions as well as they must support the latest information technologies. Such solutions are expected from users and other stakeholders.

The first monograph contained only articles written by researchers and Ph.D. students from the Department of Computer Science at Wrocław University of Economics. In the years 2002-2006, the publication was given national character by linking it with National Scientific Conferences under the same title as the monograph series. The list of authors includes a large number of Polish universities, consulting and integration firms. The monograph also contained articles written by invited foreign researchers. As a result, the scope of the monograph has been extended and the publication has gained a kind of “added value”. The monograph presents various points of view, perspectives, and research results derived from diverse concepts and scientific foundations.

This year all papers have been published only in English to propagate this monograph in foreign countries.

Editors of this volume would like to thank the referees for insightful and critical reviews of all articles. These reviews have been invaluable for the authors in the preparations of the final versions of papers.

Wrocław, December 2007

J. Korczak, H. Dudycz, M. Dyczkowski
